

CDS = credit default swap

value of the firm

	other stuff
→	equity (stocks)
→	debt (bonds)

CAPITAL STRUCTURE

$$A = E + D$$

---

Merton (1974)

$$dV = rV dt + \underline{\sigma} V dW$$

$$dS = rS dt + \sigma S dW$$

Merton (1974)

$$\underset{\text{assets}}{A(t)} = \underset{\text{debt}}{D(t)} + \underset{\text{equity}}{E(t)}$$

firm

solvency:  $A(T) > F$  :  $\begin{cases} E \leftarrow A(T) - F \\ D \leftarrow F \end{cases}$

insolvency:  $A(T) < F$  :  $\begin{cases} E \leftarrow \text{nothing} \\ D \leftarrow A(T) \end{cases}$

equity:

$$E(T) = \max[\underline{A(T)} - F, 0]$$

European Call:

$S(T)$      $K$   
"equity is call option  
on the assets of the  
firm"

Riskfree  $\rightarrow \underline{ZCB}(t) = \underbrace{(1)}_{\text{paid}_T} \exp[-(r)(T-t)]$

Risky bonds  $\rightarrow \underline{ZCB}(t) = \underbrace{(1)}_{\text{paid}_T} \exp[-(r+s)(T-t)]$

$$D(t) = F \exp[-(r+s)(T-t)]$$

$$\log(D/F) = -(r+s)(T-t)$$

$$\frac{1}{(T-t)} \log(D/F) = -r - s$$

$$\rightarrow s = \frac{1}{(T-t)} \log\left(\frac{D}{F}\right) - r$$

$$dv = rldt + \sigma v du + \textcircled{J}$$

$$dV = rV dt + \sigma V dW \quad (\text{GBM})$$

Euler discretization:

$$V_{i+1} - V_i = r V_i \Delta t + \sigma V_i \underbrace{(dW)}_{\downarrow}$$

$$V_{i+1} = V_i + r V_i \Delta t + \sigma V_i \underbrace{\sqrt{\Delta t} N(0,1)}$$

$$V_{i+1} = \underline{V_i} \left( 1 + \underline{r} \Delta t + \underline{\sigma} \sqrt{\Delta t} \underline{N(0,1)} \right)$$

$$\sim \left( \sum_{i=1}^{12} u_i - 6 \right)$$
